

Trie(Insert and Search)

[Problem](#)[Submissions](#)[Leaderboard](#)

RATE THIS CHALLENGE

Trie is an efficient information retrieval data structure. Use this data structure to store Strings and search strings. Your task is to use TRIE data structure and search the given string A. If found print 1 else 0.

Input Format

N=8 key[]={the,a,there,answer,any,by,bye,their} search=the

Constraints

Expected Time Complexity: $O(M+|search|)$. Expected Auxiliary Space: $O(M)$. M = sum of the length of all strings which is present in the key[]

|search| denotes the length of the string search

$1 \leq N \leq 104$ $1 \leq |input\ strings|, |A| \leq 100$

Output Format

1

Sample Input 0

```
8
the,a,there,answer,any,by,bye,their
the
```

Sample Output 0

1

Sample Input 1

```
8
the,mall,there,answer,any,by,bye,their
mango
```

Sample Output 1

0

Language

Python 3

```
1 class TrieNode:
2     def __init__(self):
3         self.children = {}
4         self.is_end = False
```

```
5
6
7 class Trie:
8     def __init__(self):
9         self.root = TrieNode()
10
11     def insert(self, word):
12         node = self.root
13
14         for ch in word:
15             if ch not in node.children:
16                 node.children[ch] = TrieNode()
17
18             node = node.children[ch]
19
20         node.is_end = True
21
22     def search(self, word):
23         node = self.root
24
25         for ch in word:
26             if ch not in node.children:
27                 return False
28
29             node = node.children[ch]
30
```
